#### **Director General**

National Institute of Population Research and Training Ministry of Health and Family Welfare

#### **FOREWORD**

In Bangladesh, information on utilization of maternal health services is rarely available at district level. The 2010 Bangladesh Maternal Mortality and Health Care Survey (BMMS) created an opportunity to address this information gap. The purpose of the survey is to build a reliable database on maternal health and maternal death for policy makers and the research community.

The present report highlights district-level Socio-demographic and Health Care Utilization indicators in Bangladesh. Hopefully, this will facilitate use of district-level data for local-level planning and monitoring of maternal health indicators. I hope that the policy makers, program managers, researchers and others interested would find the survey report to be a useful reference document on maternal health.

The 2010 BMMS is the second large national survey conducted in Bangladesh. The survey was carried out under the authority of NIPORT. Moreover, MEASURE Evaluation, UNC-CH, USA, ICDDR,B and USAID provided technical assistance for conducting the survey. Two Bangladeshi private research firms – 'Associates for Community and Population Research (ACPR)' and 'Mitra and Associates' assisted considerably in collecting the survey data. The financial support for the survey was provided by the Government of the People's Republic of Bangladesh, USAID, AusAID and UNFPA.

I am grateful to the contributors who have so generously helped to bring out this research report. I also express my gratitude to the professionals of NIPORT, MEASURE Evaluation, ICDDR,B and USAID for their sincerest efforts in publishing this report.

(Shelina Afroza PhD)

#### **INTRODUCTION**

#### **BACKGROUND**

The purpose of this report is to present health care utilization and socio-demographic indicators at the district level. The data from this report comes from the 2010 Bangladesh Maternal Mortality and Health Care Survey (BMMS). The objective of the 2010 BMMS was to collect data on the level and causes of maternal mortality and the utilization of maternal health services in Bangladesh. The survey also collected other information such as household socio-economic conditions, education, reproductive health and childhood mortality.

Most national surveys concerning the health sector provide data on the country's socio-economic development, health and family planning only down to at the division level. There is a need for district level data for monitoring of program indicators at that level. Due to the large sample size of the BMMS, it is possible to present utilization of services and socio-economic information at the district level.

#### **METHODS AND INDICATORS**

The 2010 BMMS used a representative sample designed to provide estimates for maternal mortality at the national level and for most other indicators at the national, urban/rural, divisional, and district levels. The first two stages of the three stage sampling procedure relied on sampling frames derived from the 2001 Census. In the first stage of selection, there were three statistical strata: urban, "other urban," and rural areas. Wards, urban areas of unions, and rural areas of unions served, respectively, as the primary sampling units (PSUs) in these strata. The second stage of sampling involved selecting two mohallas from each selected ward and two mouzas from each selected union in the other urban and rural areas.

One cluster was selected from each selected mohalla and mouza. A total of 654 urban, 488 other urban, and 1,566 rural clusters were selected, for a total of 2,708 clusters overall. Within each selected cluster a sample of 65 households was randomly selected. Of the 175,600 households selected for the sample, 168,629 households were successfully interviewed. Verbal autopsies were conducted for all deaths in the last three years of women age 13-49 in these households to ascertain the causes of death and identify all maternal deaths. Finally, a total of 180,422 women age 13-49 living within these household were eligible for individual interview, of whom 175,621 women were successfully interviewed (for a response rate of around 97%).

The following indicators are presented in this report:

#### Reproductive health

- Total fertility rate (TFR);
- Percentage of female adolescent (age 15-19) currently married;
- Contraceptive prevalence rate (any method and modern method);

#### Socio-economic development

- Percentage of households with electricity;
- Percentage of households with sanitary toilet;
- Percentage of households with improved housing;
- Percentage of households owning a radio;
- Percentage of households owning a TV;
- Percentage of households in lowest quintile (poorest households);
- Percentage of children aged 12-15 with completed primary education;
- Percentage of children aged 15-19 with completed primary education;
- Percentage of male and female aged 18-24 with completed primary and secondary education;
- Percentage of male and female aged 20-24 with completed secondary education;

#### **Infant and child mortality**

- Neonatal mortality rate;
- Postneonatal mortality rate;
- Infant mortality rate;
- Child mortality rate;
- Under-five mortality rate;

#### Maternal health

- Antenatal care from any provider;
- Antenatal care from medically trained provider;
- At least four or more antenatal care from any provider;
- Delivery attended by skilled birth attendant;
- Delivery at health care facility;
- Postnatal care for mother from any provider within 2 days of delivery;
- Postnatal care for mother from medically trained provider within 2 days of delivery.

#### IMPLEMENTING OGRANIZATIONS

The BMMS-2010 was conducted under the authority of NIPORT of the Ministry of Health and Family Welfare. MEASURE Evaluation, ICDDR,B, and USAID provided technical assistance in all phases of the survey. NIPORT employed two local research firms/agencies (Mitra and Associates and Associates for Community and Population Research-ACPR) for field data collection, data editing, and data entry.

#### **FUNDING SOURCES**

The Government of the People's Republic of Bangladesh funded the field survey, quality control, data editing, and data entry activities under the NIPORT operational plan of Training Research and Development of the Health, Nutrition and Population Sector Program. In addition, USAID funded MEASURE Evaluation while AusAID and UNFPA provided funds to ICDDR,B.
