1. Introduction and Background

1.1. Purpose of the NHSDP Baseline Survey

The United States Agency for International Development (USAID)/Bangladesh requires an external impact evaluation of the “Nongovernmental (NGO) Health Service Delivery Project” (NHSDP) program that was awarded to Pathfinder International in December 2012. The impact evaluation will use a difference-in-difference (DID) strategy to determine program impact. This design requires collecting baseline and endline data in program intervention areas and similar comparison areas, which serve as the counterfactual for the impact evaluation. The main objective of the 2014 NHSDP baseline survey was to measure USAID performance indicators related to health and family planning that the program seeks to improve in program intervention areas and in similar comparison areas (where NHSDP is not in operation). The survey provides baseline characteristics for assessing the program’s performance at the population level. Additionally, the survey collected information on individual, household, and neighborhood-level characteristics associated with health outcomes and health behaviors.

1.2. Country Context

Bangladesh has experienced a rapid decline in fertility since the 1980s following strengthened government family planning efforts since 1979, in close collaboration with donor partners. The decline in fertility contributed to other favorable health outcomes—under-five mortality is not far from the Millennium Development Goal of 48 deaths per thousand live births set to be achieved by 2015, while the maternal mortality ratio has declined by 40 percent over the last decade (2010 BMMS). Due to a young population, resulting from the momentum of a high rate of population growth in the past, family planning and maternal, newborn, and child health (FP-MNCH) services need to be strengthened further to meet demands of the increasing numbers of men and women entering their reproductive years. In order to achieve the national fertility goal of 1.8 children per woman, contraceptive prevalence rate among currently married women has to increase to around 72 percent from its current level of 62 percent, as reported in the latest round of Bangladesh Demographic and Health Survey (DHS 2014).¹ Despite the government’s continued efforts, the level of unmet need for family planning among married women currently stands at 12 percent. Contraceptive method mix is heavily reliant on short-acting methods even among women wishing to limit births which can lead to unwanted pregnancies and method switching or discontinuation, not to mention increased programmatic costs. The total fertility rate continues to be at least half a child higher than the estimate for total wanted fertility.

Utilization of maternal healthcare continues to remain low in the country. Only 31 percent of pregnant women receive the recommended four or more antenatal (ANC) check-ups and 42 percent of births were assisted by skilled birth attendants (SBA). Women from the poorest socio-economic strata are systematically marginalized in seeking maternal health care.

Currently there are three types of health service providers in the country—government, private, and NGO. Government/public providers usually charge no direct fees for services, whereas private ones (inclusive of traditional practitioners) and NGOs usually do. Public healthcare provision in urban

¹ Unless otherwise stated, all statistics in this section are taken from the 2014 DHS.

and rural Bangladesh falls under different jurisdictions. The Ministry of Health and Family Welfare is the primary health care provider in rural areas providing services through various channels: using fieldworkers who provide door-step services, outreach satellite spots, community clinics, Union Health and Family Welfare Centres, and sub-district health complexes. This kind of extensive infrastructure is largely absent in urban areas of the country— particularly in the City Corporations—where the Ministry of Local Government and Rural Development and Cooperatives is in charge of providing primary healthcare (Osman 2009).

1.3. Project Description

The NGO Health Service Delivery Project (NHSDP) is USAID's flagship health service delivery project in Bangladesh. It has been in existence in various forms since the 1990s. The last phase of the program, known as Bangladesh Smiling Sun Franchise Program (BSSFP)—implemented by Chemonics International—was the largest social franchise for healthcare in the world, serving a catchment population of over 20 million (Schlein and Kinlaw 2011). Social franchising is a service delivery model that aims to address oversight, quality, and scale in the private sector, by organizing small independent health care businesses into quality-assured and brand-recognized networks. A midline review of BSSFP, however, recommended moving away from the strict sense of the "franchise" model. The review recommended that instead of trying to establish a franchise, BSSFP should create an NGO consortium governed by the NGOs, which would own the Smiling Sun brand, establish its own priorities and cost-recovery targets, and secure additional donor funds for sustainability (Anderson et al., 2010).

The current five-year phase is funded by USAID and the United Kingdom Department for International Development (DFID). It is designed to expand access to and use of primarily maternal and child health services among the poor and underserved in the country. The project supports local NGO partners to offer an essential service package (ESP) in an integrated manner; make improvements that enhance efficiencies; expand reach, particularly for the poor; and incorporate new technologies, as appropriate. The project is committed to delivering essential health services in urban and rural areas that have low service utilization rates, are traditionally underserved by the government network and/or by other donors, and offer the greatest potential for synergy with other USAID-funded projects under the Feed the Future Initiative. Currently, these USAID supported local NGOs provide an ESP comprising FP-MNCH and basic health services² to a catchment population of over 20 million people in both urban and rural areas of the country.

The project is expected to expand the client base for ESP, increase adoption of healthy behavior, and enhance local ownership of service delivery. Achievement of project objectives will be tracked using selected outcome indicators: for example, use of maternal health services and family planning, as well as changes in knowledge, attitude, and practice in the target population (e.g., on safe delivery practices and newborn care). The capacity of participating NGOs to plan and manage service delivery in collaboration with the government will also be an important outcome, although this evaluation will not address this aspect of the project.

² The services provided by NHSDP NGOs are family planning, antenatal care, postnatal care, delivery care, immunization, treatment for diarrhea, acute respiratory infections, Vitamin A supplementation, and other curative services. Fifty-eight of the urban static clinics provide directly observed treatment, short-course (DOTS) treatment for tuberculosis (TB) in addition to the aforementioned services, while the remaining clinics make TB referrals.

The USAID NGO health service delivery program has traditionally operated in areas identified by the Government of Bangladesh (GOB) to have inadequate public health service delivery systems, and where the GOB sought assistance from partners to fill the service gap. The program has been implemented in all 64 districts of the country, covering the GOB designated areas in each district, through a network of 26 local NGOs employing three channels of service provision: 388 static clinics (206 urban and 182 rural); more than 10,000 satellite spots, and more than 7,300 community mobilizing personnel. The rural and urban components of the program are slightly different, to account for the fact that players, dynamics, and infrastructure are different in urban and rural Bangladesh. For example, the role of the community mobilizing agent in urban areas, known as a service promoter, is not as extensive as that of the community service provider (CSP) in rural areas, known as a "depot holder." The proliferation of different health service providers in urban areas makes it challenging to define boundaries for the catchment area of each type of provider. Therefore, the evaluation is conducted separately for urban and rural areas.

The GOB-assigned catchment population for USAID's last NGO health service delivery program—BSSFP—was a little more than 20 million. Under the current phase of the NGO health-service delivery program, the implementing agency—Pathfinder International—plans to expand services to an additional 8.3 million in underserved, hard-to-reach areas of the country. The program expects to reach about 2.1 million of these additional people through adding satellite sessions around existing NHSDP sites. The remaining 6.2 million are expected to be reached by establishing new sites in government-identified and -allocated hard-to-reach areas. Identifying and establishing these new sites will take time, and the new clinics may not be functional until the end of the second or even third year of the project. Therefore, the new areas covering the 6.2 million new catchment population are not included in the 2014 baseline survey and the impact evaluation.

NHSDP has a strong focus on behavior change communication (BCC). Largely through community mobilization and use of printed material at static/satellite clinics, the project expects to bring about changes in a number of BCC indicators in the communities where they operate, including knowledge of the five danger signs of pregnancy and three delays for childbirth (as part of birth preparedness) and areas of essential newborn care, including benefits of early and exclusive breastfeeding. Other BCC activities in the project include promotion of safe delivery kits and of *Shurjer Hashil/Mayer Bank* (kitty for maternal emergencies) as part of birth planning.

1.4. Evaluation Methodology

The overall evaluation methodology relies on collection of baseline and endline data on the outcomes of interest in program and nonprogram comparison areas. The baseline household survey was conducted in early 2014, about one year into the project. The endline household survey is expected to be conducted at the end-of-project implementation in 2017. The same clusters will be visited at two points in time (baseline and endline) to assess the extent of change in the indicators of interest. The estimation strategy for the impact evaluation of the NHSDP program will be a DID strategy, using control variables in a regression model. In the classical sense, this model identifies the impact of a program as the difference between a sample of participants (population of NHSDP intervention areas) and nonparticipants (population of comparison areas) in terms of the trend each experienced in an outcome, from a baseline point before the program has been implemented to an endpoint after it has been implemented (Bertrand, Duflo, and Mullainathan, 2004). The assumption of this model is that, in the absence of the intervention,

the project and comparison area populations would experience the same trend in outcomes. The major strength of the DID approach is that it addresses two potential sources of bias from unobserved factors: time trends in the outcomes unrelated to the program, and preexisting differences in the outcomes among program and comparison areas. The DID approach's ability to address preexisting differences is desirable for this impact evaluation because program areas were not randomly selected and therefore may differ systematically from comparison areas in preexisting conditions (e.g., the health service environment and socio-demographic characteristics) that could influence the outcomes.

Evaluation Questions

Evaluation of NHSDP will address two primary and two secondary questions.

Primary evaluation questions

1. How much does use of selected MNCH and FP services (ANC, SBA, CPR) increase in NHSDP program areas?
2. Does NHSDP increase use of selected MNCH and FP services at least by an amount comparable with that achieved in neighboring comparison areas that are served by non-NHSDP providers?

Secondary evaluation questions

1. Are the increases in use of selected MNCH and FP services among poorer (lower two wealth quintiles) similar to those achieved among wealthier (upper three wealth quintiles) populations?
2. Does the market share of NHSDP for key MNCH and FP services increase in program areas over the life of the project? If so, by how much?

One of the mandates of this NHSDP phase is to increase service contacts by 25 percent. The evaluation will focus primarily on change in coverage and uptake of FP and MNCH services in intervention areas in relation to comparison areas that are served by non-NHSDP providers. These outcome indicators are collected from individual interviews with ever-married women of reproductive age (MWRA) identified in a household survey. Comparison areas will be selected from communities that do not receive NHSDP interventions and are adjacent to (or near, if no adjacent comparison communities exist) NHSDP intervention areas. This will ensure that comparison areas are as similar as possible to NHSDP intervention areas in terms of socioeconomic and cultural characteristics.

1.5. Sample Design of the 2014 NHSDP Baseline Urban Survey

The urban component of the 2014 NHSDP baseline survey employed a representative sample of households in program areas defined by the NHSDP catchment areas. Additionally, a sample was drawn from urban nonprogram areas geographically adjacent to but outside of NHSDP catchment areas. The urban component of the 2014 NHSDP baseline survey was intended to provide estimates for the two sample domains: the project and comparison domains. The domains are drawn from Dhaka City Corporation, Chittagong City Corporation, remaining City Corporations, and District and Thana Municipalities. The sampling frame of the project domain was constructed from the list of NHSDP project catchment areas provided by participating NGOs and was sorted by the participating NGOs and Thana/Upazila for implicit stratification.

The survey employed a stratified two-stage cluster sample of households in both NHSDP project and nonproject comparison domains. In the project domain, catchment areas of NHSDP static or satellite clinics were used as the clusters. At the first stage, 210 project clusters were randomly selected from the list of NHSDP catchment areas, with probability proportional to size (PPS), where size was the number of households estimated in the catchment area from the number of eligible couples (ELCOs). Seven project clusters were replaced with reserve clusters, because they turned out not to be covered by the project at the time of the survey.

In the nonproject comparison domain, areas in which NHSDP did not operate or geographically adjoin an NHSDP catchment area were identified based on a precise mapping of the geographic boundaries of the catchment areas. These areas were used as clusters for the comparison domain. The areas were often defined by *para/moholla*, and when the *moholla* was large, it was divided into equal-size segments. Then a randomly selected *para/moholla* or its segment served as the cluster. When a selected project cluster did not have immediately adjoining urban areas in which NHSDP operated, the nearest nonprogram *para/moholla* was selected as the comparison cluster. In some areas, most notably in Chittagong Division, there were no nearby urban areas in which NHSDP was not operating.³ To address this problem of project areas without nearby nonproject comparison areas, a list of all urban *Thanas* where NHSDP was not operating was prepared by region. When a project area did not have a nearby nonproject comparison area, a nonproject comparison cluster for the project area was randomly selected from the same region based on the list. Fifty-two nonproject comparison clusters were selected in this manner. Mapping and segmentation of large clusters followed a detailed sampling protocol. A total of 199 nonproject comparison clusters were selected from areas adjoining or near NHSDP areas.

At the second stage of sampling in both NHSDP project and comparison areas, a fixed number of households within selected clusters were selected with equal probability to yield a representative sample of ever-married women aged 12-49. In every selected cluster, all households were listed, proceeding from the northwest corner of the area. The sampling employed a systematic random sampling to select 35 households from each cluster. Then all eligible women of the selected households were invited to participate in the survey. Ultimately, 7,260 ever-married women age 12-49 were interviewed from NHSDP areas and 6,913 were interviewed from nonproject areas.

1.6. Implementation of the Survey

The urban component of the 2014 NHSDP baseline survey was implemented by Mitra and Associates, a research firm located in Dhaka. A research team from Mitra and Associates, headed by S.N. Mitra, was responsible for the implementation of the survey. MEASURE Evaluation, a USAID-funded project implemented by the Carolina Population Center at the University of North Carolina at Chapel Hill, provided technical assistance for the survey.

1.7. Survey Instruments

Three instruments were used for the 2014 NHSDP urban baseline survey: household listing schedule, household and women's questionnaire, and community questionnaire. These survey instruments were

³ In Chittagong, NHSDP was operating in the majority of urban areas. In some smaller urban centers, NHSDP was operating in the entire urban area and all adjacent areas were rural and therefore could not be used as comparison areas for the urban survey.

initially developed by MEASURE Evaluation, reviewed by USAID/Dhaka, and pretested by Mitra and Associates. The questionnaires were initially developed in English and then translated into Bangla.

Household Listing Schedule

The household listing schedule was used to conduct household listing operations in each selected cluster to produce a sampling frame for the systematic random sampling of households within clusters.

Household and Women's Questionnaire

The household and women's questionnaire consisted of two parts. The household part of the questionnaire was usually administered to a primary household member (i.e., household head or female respondent) and was used to list all usual members and visitors in the selected households. Some basic information was collected on the characteristics of each person, including age, sex, marital status, and the individual's relationship to the household head. The main purpose of the household part of the questionnaire was to identify ever-married women ages 12–49 years for individual interviews. In addition, information was collected about the dwelling itself, such as the source of water, type of toilet facilities, materials used to construct the house, and ownership of various consumer goods.

The women's part of the questionnaire was administered to all ever-married women ages 12–49 in the sampled households. The women were questioned about the following topics:

- Background characteristics (age, current marital status, education, religion, exposure to mass media, NGO membership, access to mobile phone, and food security, etc.)
- Reproductive history
- Knowledge and use of contraceptive methods
- Birth planning, pregnancy, delivery and postnatal care, breastfeeding practices, infant and young child feeding practices
- Knowledge about health service providers

Community Questionnaire

The community questionnaire was administered to a group of knowledgeable community leaders (teachers, local leaders, and health service providers, etc.) within each selected sample cluster during the household listing operation. The questionnaire collected information about important community characteristics, existing health facilities, health and FP workers, depot holders, the availability of doctors and pharmacies, and the existence of other programs provided by NGOs in the survey cluster/mouza of NHSDP project and nonproject comparison areas.

1.8. Training and Fieldwork

Training and Fieldwork for the Household Listing and Community Survey

Training for the household listing and community survey was conducted over a week in mid-February 2014. The household listing and community survey for the 2014 NHSDP urban baseline survey was conducted between 24 February and 23 June, 2014.

Training/Pretesting and Fieldwork for the Household and Women's Survey

Training for data collection was conducted between 18 March and 7 April, 2014. The first pretest took place at the end of March 2014 and the second one in early April 2014. Fieldwork for the survey was done between 10 April and 17 August, 2014.

Mitra and Associates had their own data quality control mechanisms in place for fieldwork. In addition, MEASURE Evaluation staff based in Dhaka made periodic field monitoring visits. Field check tables were generated regularly during fieldwork to monitor data quality and performance of individual data collection teams. Any problems identified were shared with the data collection agency for corrective action. Debrief sessions were held at the end of each phase of fieldwork to discuss any problems encountered during data collection.

1.9. Data Processing

Editing, coding and data entry were done at the Dhaka central office of the data collection agency between 3 May and 25 September, 2014. The final dataset was delivered to MEASURE Evaluation in Dhaka in October 2014.

1.10. Response Rates

Table 1 shows the results of the household and women's interviews. A total of 14,279 households (7,350 project and 6,929 comparison) were selected for interview. Of these, 13,654 households (7,015 project and 6,639 comparison) were successfully interviewed, yielding a household response rate of 98.4%. The principal reason for nonresponse was either that the dwellings were vacant or the inhabitants were absent for an extended period during the time that they were visited by the interview teams.

In the interviewed households, 14,855 women (7,632 project and 7,223 comparison) were identified as eligible for interviews (i.e., ever-married women ages 12–49 years). Of the eligible women, 14,173 (7,260 project and 6,913 comparison) were interviewed, yielding an individual response rate of 95.4%. Response rates were nearly identical in project and comparison areas. The principal reason for non-response among individual women was their absence from home despite repeated visits.

Table 1: Results of the household and individual interviews

	Project areas	Comparison areas
Household sampled	7,350	6,929
Household found	7,143	6,732
Household interviewed	7,015	6,639
Household response rate (%)	98.2	98.6
Eligible women found	7,632	7,223
Eligible women interviewed	7,260	6,913
Eligible women response rate (%)	95.1	95.7

2. Key Findings

This chapter presents baseline data relevant to the evaluation questions for three priority FP-MNCH outcome indicators. In addition, results of balance tests to check the comparability of program and nonprogram areas are presented. Detailed tabulations from the urban baseline survey are presented in Appendix A.

2.1. Use of Reproductive Health Services

The main objective of the evaluation was to assess whether the levels of use of selected FP-MNCH services in project areas were at least comparable to levels observed in adjacent comparison areas that were served by other providers. Achievement of NHSDP project objectives will be tracked using selected outcome indicators. Three indicators pertaining to utilization of FP and maternal health care services are of particular interest (Table 2). The majority of married women of reproductive age use modern methods of family planning. The prevalence of modern methods of contraception was slightly higher in urban project areas—60 percent, compared with 58 percent in comparison areas ($p=0.05$). Higher use of modern contraception is explained by higher use of injectables in urban project areas. Use of female sterilization, however, was slightly higher in nonproject areas (Tables 5.1A and 5.1B in Appendix A). For the second indicator, that is, women who had received antenatal care from medically trained providers for their most recent birth, use was lower in project areas by one percentage point (81 versus 82 percent), but this difference is not statistically significant. Use of a qualified doctor for ANC was 77 percent in comparison areas compared with 72 percent in project areas (Table 7.1A and 7.1B in Appendix A). For the final indicator, skilled birth attendant,⁴ use was 57 percent in project areas compared with 55 percent in nonproject areas (not statistically significant).

Table 2: Summary of 2014 NHSDP baseline results for key indicators, urban project, and comparison areas

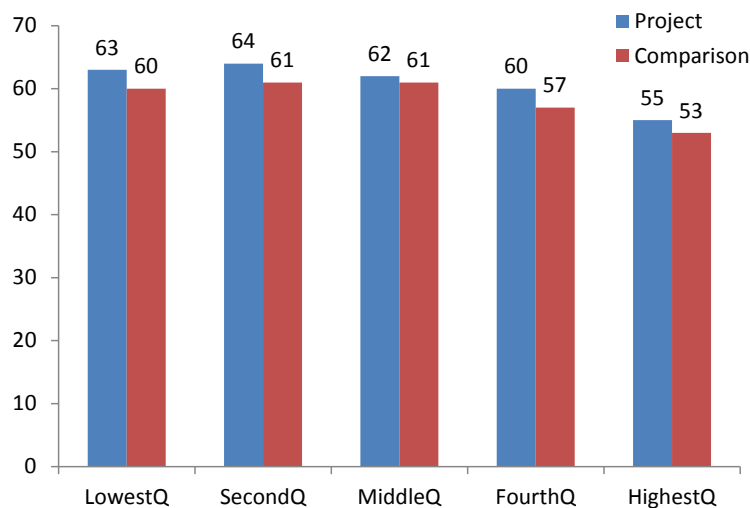

IR-2: Optimal Healthy Behavior Promoted		
<i>Sub 1R 2.1: Healthy Behavior and Care-Seeking Practices Improved through Behavior Change Communication</i>	Project areas	Comparison areas
1. Contraceptive prevalence rate of modern methods among currently married women age 15-49 (%)	60	58
2. Percentage of women with a live birth during the three years preceding survey who received ANC from a medically trained provider	81	82
3. Percentage of live births during the three years preceding survey that were attended by skilled birth attendants	57	55

This evaluation has two secondary questions—to assess whether use increases among the poor as much as among the wealthy between the baseline and endline surveys and whether NHSDP's market share in provision of services increased over the five-year period.

⁴ Skilled birth attendant is defined as a medically trained provider in Bangladesh, and the two terms are used interchangeably for delivery care in this report.

The NHSDP urban baseline survey indicates that modern contraceptive prevalence in project areas is higher among the lower two wealth quintiles, 63 percent and 64 percent, respectively, than among the higher wealth quintiles (Figure 1). A similar pattern is seen in comparison areas. Use of injectables is four times higher among women in the poorest quintile than among those in the highest quintile. Women from the lower quintiles are more likely to be using permanent methods (Tables 5.1A and 5.1B in Appendix A). Results from nationally representative surveys like the Bangladesh Demographic and Health Survey (BDHS) also suggest that use of modern contraception is higher in the lower wealth quintiles than in the higher wealth quintiles in both urban and rural areas of the country. Modern contraceptive prevalence is higher in project than in comparison areas in every quintile.

Figure 1: Use of modern contraception among currently married women ages 15–49 by wealth quintile and by project and comparison areas, urban NHSDP 2014

The Ministry of Local Government and Rural Development and Cooperatives is in charge of providing primary healthcare services in urban areas. The GOB infrastructure for providing healthcare in urban areas is not as extensive as in rural areas, with the GOB seeking the assistance of NGOs to fill the gaps. NHSDP and the Urban Primary Health Care Project (UPHCP) are the two largest networks of NGOs commissioned by the GOB to fill the health service delivery gaps in urban areas. That said, there has been a proliferation of private providers (inclusive of the informal sector), who are the dominant providers of health services in urban areas (Adams et al., 2015).

Figure 2 confirms that the private sector is the primary provider of modern contraception, even in project areas, providing services to more than half (55 percent) of users. Smiling Sun, which is the brand name used by NHSDP network, is the second most widely used source for modern contraception in project areas closely followed by the public sector—21 and 19 percent, respectively. Smiling Sun satellite sessions are the dominant Smiling Sun providers of family planning services in urban areas. High reliance on temporary methods in the national method mix plausibly explains the low use of NHSDP static clinics as a source for modern contraceptives. The majority of urban users of pills and condoms obtain their supplies from private pharmacies, consistent with other national surveys, but Smiling Sun is the source for more than half of injectable users in project areas (Appendix A, Tables 5.2A and 5.2B). Other NGOs hold a minimal market share in NHSDP urban project areas as seen in Figure 2—only 5 percent. The public

sector is the second most important source of family planning in comparison areas with the NGO sector serving 11 percent of contraceptive users. Only 2 percent of users in comparison areas report obtaining their method from a Smiling Sun provider suggesting little contamination of comparison areas by NHSDP activities despite the geographic proximity of most comparison areas to project areas.

Figure 2: Source of modern contraception among users in project and comparison areas, urban NHSDP 2014

In contrast to modern contraceptive use, utilization of ANC is not equitably distributed (Figure 3). Less than 70 percent of women with a recent birth in the poorest quintile in urban project areas had used ANC from a medically trained provider compared with 95 percent in the richest quintile. Similar patterns in equity in ANC from medically trained providers are seen in comparison areas but is slightly more pronounced. The difference in ANC from medically trained providers between project and comparison areas is most pronounced for the second and middle wealth quintiles.

Figure 3: Antenatal care from medically trained providers by wealth quintile and by project and comparison areas, urban NHSDP 2014

For ANC, users can potentially go to multiple providers, both medically trained and not medically trained. Among women in urban project areas who had a live birth in the three years preceding the survey, more than 16 percent received ANC from medically trained providers belonging to the Smiling Sun

network (Table 7.2 in Appendix A). Use of static clinics was twice as high as use of satellite clinics among those receiving ANC from NHSDP MTPs in urban project areas (Table 7.4 in Appendix A). Qualified doctor is the primary provider of ANC from MTP in both project and comparison areas—more so in comparison areas (Table 7.1A and 7.1B in Appendix A). As seen in Figure 4, about 5 percent of women in comparison areas reported using Smiling Sun providers for ANC, demonstrating low spillover of project services to adjacent comparison areas.

Figure 4: Source of antenatal care from medically trained providers among women with a live birth in the three years before the survey, by project and comparison areas, urban NHSDP 2014

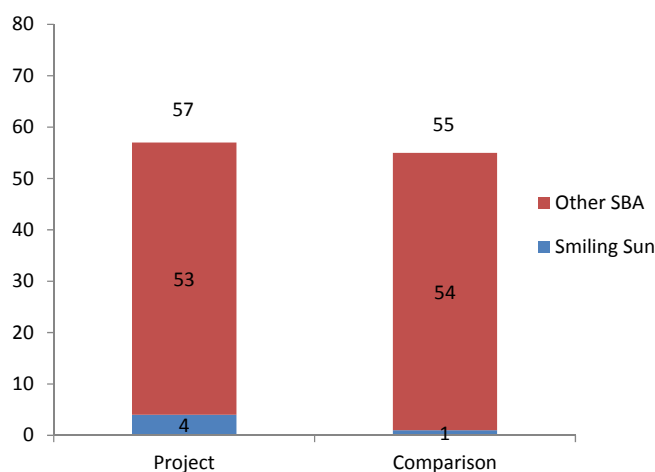

In project areas, women in the highest quintile were almost two and a half times more likely to have used an SBA during delivery in the three years preceding the survey than women in the poorest quintile (Figure 5). The second poorest quintile in project areas was almost half as likely as the wealthiest quintile to have used an SBA. This pattern of inequity in use of SBAs exists in comparison areas too and is slightly more pronounced. Use of SBA for delivery is slightly higher in the poorest two quintiles in urban project areas than in comparison areas.

Figure 5: Use of skilled birth attendants during delivery among women with a birth in the three years before the survey, by wealth quintiles and by project and comparison areas, urban NHSDP 2014

Few women utilized SBAs who belonged to the Smiling Sun network—4 percent out of a total 57 percent who used an SBA in project areas and 1 percent in comparison areas (Figure 6). As far as facility delivery is concerned, the vast majority of women in both urban project and comparison areas used the private sector followed by public health facilities (Table 7.9 in Appendix A).

Figure 6: Source of skilled birth attendants among women with a birth in the three years before the survey, by project and comparison areas, urban NHSDP 2014

2.2. Comparability of Project and Nonproject Areas

The underlying parallel trend assumption of the DID model is more plausible if the project and comparison areas are similar with regard to characteristics associated with the outcomes of interest, such as socioeconomic conditions and respondents' background characteristics. Comparison areas adjacent to project areas were selected because they were expected to be similar to project areas but were served by non-NHSDP health providers.

We compared selected indicators of background characteristics, and knowledge and practice of FP-MNCH care, between project and comparison areas and performed statistical tests of the difference in each indicator. These are called balancing tests, which help to assess the balance between project and comparison areas. The results of the balance tests are presented in Appendix B. Tests were done for a total of 50 indicators, out of which nine (18 percent) were statistically significantly different (Table 3).

Table 3: Summary statistics from balance tests, urban NHSDP 2014

Indicator group	Number of indicators tested	Number of indicators that are significantly different between project and comparison areas	
		Number	Percentage (%)
Household characteristics	9	2	22
Respondents' characteristics	20	2	10
Contraceptive use	2	1	50
Maternal and newborn healthcare	19	4	21
Total	50	9	18

Four out of the 29 indicators related to household and respondents' background characteristics were significantly different in project and comparison areas. The proportion of households with "earth/sand" as main flooring material was statistically significantly less in urban project areas (Table 1 in Appendix B). There were also significantly more households with electricity in project areas. The proportion of households in the poorest/lowest wealth quintile in project areas was 17 percent compared with 21 percent in comparison areas. Finally, the proportion of currently married women of reproductive age who were living with their husbands was higher in project areas. This could explain why use of modern contraception is higher in project areas (Table 3 in Appendix B).

We conducted balance tests for three indicators on birth planning (Table 4 in Appendix B). No difference was found in these indicators between project and comparison areas. We then compared 16 indicators on maternal healthcare use and newborn care practices out of which four were different between project and comparison areas. The proportion of women with more than 4 ANC visits provided by any provider was higher in project areas (Table 5 in Appendix B). Women in project areas were more likely to have heard about *Shurjer Hashi/Mayer Bank*. This is a new intervention of NHSDP encouraging pregnant women to invest in a kitty for maternal emergencies.

Two of the indicators related to postnatal care (PNC) were higher in comparison areas—proportion of mothers and proportion of newborns who received PNC within 48 hours of delivery from any type of provider.

Total	100.0	7,260	7,260	100.0	6,913	6,913

Table 3.2: Marital status

Percentage distribution of ever-married women ages 15–49 by marriage characteristics, according to project and nonproject areas, urban NHSDP 2014.

Marriage characteristics	Project areas	Nonproject areas
Current marital status		
Married	93.2	92.2
Separated/divorced	2.8	3.2
Widowed	4.0	4.6
Total	100.0	100.0
Married once/more		
Once	96.6	96.7
More than once	3.4	3.3
Total	100.0	100.0
Husband staying with her		
Yes	87.4	85.0
No but visited within past 12 months	3.3	3.7
No and did not visit in past 12 months	2.5	3.5
Separated/widowed/divorced	6.8	7.8
Total	100.0	100.0
Number of women	7,239	6,887

Note: Women ages 12-14 are not included in the table.

Table 3.3: Exposure to mass media

Percentage of ever-married women ages 15–49 who are exposed to specific media on a weekly basis, according to project and nonproject areas, urban NHSDP 2014.

Exposure to mass media	Project areas	Nonproject areas
Reads newspaper at least once a week	10.1	10.4
Listens to radio at least one a week	5.1	3.7
Watches TV at least once a week	81.4	77.7
Exposed to all three at least once a week	1.6	1.1
Exposed to none of the three media at least once a week	17.4	21.3
Number of women	7,239	6,887

Table 3.4: Membership in NGOs

Percentage of ever-married women ages 15–49 who belong to selected NGOs, according to project and nonproject areas, urban NHSDP 2014.

NGO	Project areas	Nonproject areas
Grameen bank	5.7	7.1
ASHA	13.3	13.0
BRAC	5.2	4.7
Other NGOs ¹	20.1	18.5
Member of at least one NGO	35.6	34.6
Number of women	7,239	6,887

Note: “Other NGO” includes PROSHIKA, Thengamara Mohila Sabuj Sangha (TMMS), and others.

Table 3.5: Programs for vulnerable people

Percentage of ever-married women ages 15–49 who are recipients of selected government support, and percentage who have a Shurjer Hashi health card, project and nonproject areas, urban NHSDP 2014.

Program	Project areas	Nonproject areas
VGD	0.3	0.5
VGF	0.6	1.2
Widow allowance	0.5	0.7
Elderly allowance	1.7	2.2
Other schemes	1.8	2.4
At least one program/scheme	4.6	6.6
Has Shurjer Hashi health card	10.8	3.1
Number of women	7,239	6,887

Table 3.6: Food security

Percentage distribution of ever-married women ages 15–49 by frequency of eating three square meals a day in past 12 months, urban NHSDP 2014.

Frequency of 3 square meals	Project areas	Nonproject areas
Mostly (3 meals per day)	71.0	70.0
Sometimes	26.4	29.0
Rarely (3 meals 1-6 times in past year)	2.6	1.0
Never	0.0	0.0
Total	100.0	100.0
Number of women	7,239	6,887

Chapter 4: Fertility

Table 4.1: Current fertility

Age-specific and cumulative fertility rates, general fertility rates, and the crude birth rate for the three years preceding the survey (1–36 months) by project and nonproject areas, urban NHSDP 2014.

Age group	Project area	Nonproject area
15-19	98	101
20-24	133	134
25-29	96	100
30-34	50	52
35-39	24	19
40-44	2	4
45-49	1	0
TFR 15-49	2.0	2.1
GFR	79	80
CBR	19.6	19.4

TFR: Total fertility rate, expressed per woman

GFR: General fertility rate, expressed per 1,000 women

CBR: Crude birth rate, expressed per 1,000 population

Table 4.2: Current pregnancy and recent births

Percentage of currently-married women ages 15–49 who are currently pregnant and who had a live birth in the past three years (1–36 months) by age and project and nonproject areas, urban NHSDP 2014.

Age group	Project area			Nonproject area		
	Currently pregnant	Live birth in past 3 years	Number of women	Currently pregnant	Live birth in past 3 years	Number of women
15-19	14.0	44.2	676	15.8	44.7	622
20-24	9.2	47.7	1,336	10.0	50.8	1,207
25-34	3.8	27.1	2,513	4.8	26.7	2,355
35-49	0.3	4.1	2,223	0.3	4.2	2,168
Total	4.7	25.3	6,747	5.4	25.3	6,351

Table 4.3A: Children ever born and living: project areas

Percentage distribution of all women and currently married women ages 15–49 by number of children ever born, mean number of children ever born, and mean number of living children, according to age group, project areas, urban NHSDP 2014.

	Number of children ever born						Total	Number of women	Mean number of children ever born	Mean number of living children

Table 5.4: Side effects

Percentage of current modern contraceptive users who experienced side effects in the past three months, by method used, project and nonproject areas, urban NHSDP 2014.

Experienced side effects in past 3 months	Project areas		Nonproject areas	
	%	N	%	N
Pill	6.7	2,034	6.2	1,897
Injectable	13.0	953	10.6	731
IUD/implants	22.3	111	24.4	124
Permanent methods	12.2	337	11.8	350
Condom	1.1	639	0.8	605
All modern methods	8.1	4,074	7.3	3,706

Table 5.5: Discussion of side effects

Percentage of current modern contraceptive users who experienced side effects who discussed the side effects with others, project and nonproject areas, urban NHSDP 2014.

Discussed side effects with...	Project areas	Nonproject areas
Husband	37.3	39.5
NHSDP health worker	17.2	2.5
Other health worker	20.8	25.8
Friends/relatives	12.3	10.4
Other	1.5	1.6
Anyone	74.0	65.6
Number of women	332	272

Note: Multiple responses allowed so percentages may not sum to 100 percent.

Table 5.6: Intention to use contraceptives in the future

Among currently married women ages 15–49 who are not currently using contraception, percentage who intend to use in the future, project and nonproject areas, urban NHSDP 2014.

Intention to use in future	Project areas	Nonproject areas
Intends to use in next 12 months	16.2	18.8
Intends to use later	38.0	37.8
Does not intend to use	45.8	43.4
Missing	0.0	0.0
Total	100.0	100.0
Number of women	2,004	2,047

Table 5.7: Preferred method for future use

Percentage distribution of currently married women ages 15–49 who are not currently using contraception but who intend to use it in the future, by preferred method according to age and project and nonproject areas, urban NHSDP 2014.

Preferred method	Project areas		Nonproject areas	
	15-34	35-49	15-34	35-49
Pill	44.0	52.1	42.3	46.9
Injectables	13.2	10.4	9.7	10.8
IUD	0.0	0.0	0.0	0.0
Implants	0.7	0.0	0.5	0.0
Female sterilization	2.0	1.9	2.0	1.0
Male sterilization	0.0	0.0	0.0	1.0
Condom	5.8	4.7	8.3	8.4
Traditional method	0.9	2.9	1.4	6.6
Other	1.9	0.0	2.6	5.1
Not sure	31.5	28.0	33.3	20.0
Total	100.0	100.0	100.0	100.0
Number of women	980	105	1,052	108

Table 5.8: Knowledge of source for nonusers

Percentage distribution of currently married women who do not currently use a modern contraceptive method but want to use one in the future, by knowledge of source of supply, project and nonproject areas, urban NHSDP 2014.

Source	Project areas	Nonproject areas
Public sector		
Hospital/medical college	21.4	17.4
Family welfare center	1.8	6.2
Upazila health complex	8.5	16.1
MCWC	13.7	13.4
Rural dispensary/community clinic	1.1	3.4
Satellite clinic/EPI outreach site	3.3	5.5
HA/FWA	6.3	12.1
Smiling Sun		
Static clinic	22.9	11.4
Satellite clinic	27.3	1.8
CSP/depot holder	2.4	0.2
Other NGO		
Hospital/clinic	6.6	10.9
Satellite clinic	1.0	2.1
Fieldworker	4.1	6.2
Private medical sector		
Private hospital/clinic/qualified doctor	6.9	8.6
Pharmacist/pharmacy	53.2	53.5
Village doctor/traditional healer/Kabiraj	0.4	0.2
Other private/shop	3.2	2.5
Doesn't know any source	4.3	4.1
Number of women	1,755	1,756

Note: Multiple responses possible, so percentages don't necessarily add to 100 percent.

Table 5.9: Discussion of family planning

Among women who are not currently using a contraceptive method but who intend to use one within the next 12 months, percentage who have discussed family planning with others, project and nonproject areas, urban NHSDP 2014.

Discussed FP with...	Project areas	Nonproject areas
Husband	28.0	26.4
NHSDP health worker	1.6	0.5
Other health worker	4.8	6.4
Friends/relatives/neighbor	3.4	3.7
Other	0.3	0.3
Anyone	36.0	32.7
Number of women	324	385

Note: Multiple responses allowed, so percentages may not sum to 100 percent.

Chapter 6. Birth Planning

Table 6.1: Decision on place of delivery and delivery attendant

Percentage distribution of currently pregnant women ages 15–49, by timing of decision on place and attendant at delivery; among those who decided, percentage distribution of place of delivery, and percentage distribution of person assisting with delivery, project and nonproject areas, urban NHSDP 2014.

Characteristics	Project	Nonproject
Time of decision on where to deliver		
1 st trimester	36.9	43.6
2 nd trimester	20.1	18.6
3 rd trimester	8.9	6.3
Not decided/doesn't know	34.2	31.5
Total	100.0	100.0
Number of women	319	341
Decided place of delivery		
Public facility	9.5	11.8
Smiling Sun (SS) facility	3.5	2.2
Private facility	18.4	16.1
Other facility	9.4	5.4
Home	59.2	64.5
Total	100.0	100.0
Number of women who decided on delivery place	212	231
Decided who to deliver with¹		
SS doctor/nurse/midwife/paramedic	0.0	0.7
Other doctor/nurse/midwife/paramedic	7.0	7.8
FWV/CSBA/MA/SACMO/HA/FWA ²	2.4	0.7
Trained TBA	23.2	13.4
Untrained TBA	41.4	50.3
Relatives/neighbor/friend/other	1.6	4.4
Not yet decided	24.3	22.7
Total	100.0	100.0
Number of women who decided home delivery	125	149

¹ If more than one provider mentioned, only the provider with the highest qualifications is considered in the tabulation.

² FWV = family welfare visitor; CSBA = community skilled birth attendant; MA = medical assistant; SACMO = subassistant community medical officer; HA = health assistant; FWA = family welfare assistant.

Table 6.2: Discussion of plans for emergency with family members

Percentage of currently pregnant women ages 15–49 who have discussed emergency preparedness plans with family members, by trimester of pregnancy, project and nonproject areas, urban NHSDP 2014.

Background characteristics	Discussed with family members				Number of women
	Where to seek assistance in case of emergency	Whom to call in case of emergency	Make arrangements for transport in case of emergency	Make arrangements for money in case of emergency	
Project areas					
1 st trimester	30.3	31.1	6.3	19.4	106
2 nd trimester	38.9	36.5	13.1	21.2	121
3 rd trimester	56.7	59.0	27.2	49.9	93
Total project	41.2	41.2	14.9	28.9	319
Nonproject areas					
1 st trimester	31.3	32.3	9.8	16.2	110
2 nd trimester	42.5	43.9	10.5	26.9	143
3 rd trimester	69.2	66.4	14.6	38.2	88
Total nonproject	45.7	46.0	11.3	26.3	341

Chapter 7. Maternal and Newborn Health

Table 7.1A: Antenatal care, urban project areas

Percentage distribution of women ages 15–49 who had a live birth in the three years preceding the survey by antenatal care (ANC) provider during pregnancy for the most recent birth, according to background characteristics, project areas, urban NHSDP 2014.

Background characteristics	Medically trained provider			Nonmedically trained provider			Percentage receiving		Number of women	
	Qualified doctor	Nurse/midwife/paramedic/FWV	CSBA/MA/SACMO	Community health worker ¹	Other	No one	Total	Any ANC

Note: If more than one source of ANC was mentioned, only the provider with the highest qualifications was considered in the tabulation.

¹ Includes health assistant (HA), family welfare assistant (FWA), Smiling Sun Franchise Program (SSFP), and other NGO health workers.

FWV = family welfare visitor; CSBA = community skilled birth attendant; MA = medical assistant; SACMO = subassistant community medical officer.

Table 7.2: Source of antenatal care

Percentage of women ages 15–49 who had a birth in the three years preceding the survey who sought ANC by type of provider, project and nonproject areas, urban NHSDP 2014.

Person seen for ANC	Project	Nonproject
Medically trained providers ¹	81.4	81.8
Smiling Sun only	16.6	4.6
Other MTP only	64.8	77.2
Both Smiling Sun and non-Smiling Sun MTP	0.0	0.0
Nonmedically trained providers ²	8.6	8.1
No one	10.0	10.1
Total	100.0	100.0
Number of women	1,738	1,638

¹ Medically trained provider includes qualified doctor/nurse/midwife/FWV;CSBA/MA/SACMO.

² Excludes those who sought ANC from MTP.

Table 7.3A: Number of antenatal care visits and timing of first visit

Percentage of women with live birth in the two years preceding the survey by number of antenatal care visits during the pregnancy for the most recent live birth and by the timing of the first visit, project and nonproject areas, urban NHSDP 2014.

Number and timing of ANC visits	Project areas	Nonproject areas
Number of ANC visits¹		
None	9.3	9.2
1	10.7	11.8
2	14.1	16.5
3	14.2	17.2
4+	51.5	45.2
Doesn't know/missing	0.1	0.1
Total	99.9	100.0
Median number of visits (for those with ANC)	4.0	3.6
Number of months pregnant at time of first ANC visit		
No antenatal care	9.5	9.3
<4 months	39.9	38.0
4-5 months	28.5	29.7
6-7 months	16.3	16.7
8+ months	5.7	6.3
Doesn't know/missing	0.0	0.0
Total	100.0	100.0
Median months pregnant at time of first visit (for those with ANC)	3.9	4.1
Number of women	1,153	1,084

¹ Number of ANC visits included visit for any ANC.

Table 7.3B: Number of antenatal care visits and timing of first visit

Percentage of women with live birth in the three years preceding the survey by number of antenatal care visits during the pregnancy for the most recent live birth and by the timing of the first visit, project and nonproject areas, urban NHSDP 2014.

Number and timing of ANC visits	Project areas	Nonproject areas
Number of ANC visits¹		
None	9.9	10.1
1	10.2	12.9
2	13.9	16.1
3	15.9	16.7
4+	50.0	44.2
Doesn't know/missing	0.1	0.1
Total	99.9	100.0
Median number of visits (for those with ANC)	3.9	3.5
Number of months pregnant at time of first ANC visit		
No antenatal care	10.1	10.2
<4 months	38.3	37.8
4-5 months	30.5	28.4
6-7 months	15.8	17.0
8+ months	5.3	6.6
Doesn't know/missing	0.0	0.0
Total	100.0	100.0
Median months pregnant at time of first visit (for those with ANC)	4.0	4.1
Number of women	1,738	1,638

¹ Number of ANC visits included visit for any ANC.

Table 7.4A: Source of antenatal care

Percentage of women with live birth in the two years preceding the survey who had at least one antenatal care visit during the pregnancy for the most recent live birth, by source of care for project and nonproject areas, urban NHSDP 2014.

Place for antenatal checkup	Project areas	Nonproject areas
Home	5.6	6.7
Medical person at home	2.4	3.3
Nonmedical person at home	3.1	3.3

Note: Table is based on most recent births in the three years, whether the children were living or dead at the time of interview.

¹ Nonmilk liquids include glucose water, fruit juice, gripe water, homemade saline, tea.

² Doctor, nurse/midwife/FWV, or CSBA.

Table 7.25: Infant and young child feeding practices

Percentage distribution of youngest children ages 6–23 months living with their mother who are fed according to three infant and young child feeding (IYCF) feeding practices based on breastfeeding status, number of food groups, and times they are fed during the day or night preceding the survey, urban NHSDP 2014.

Background characteristics	Among all children 6-23 months, percentage fed:				
	Breast milk, milk or milk products ¹	4+ food groups ²	Minimum times or more ³	With 3 IYCF practices ⁴	Number of all children 6-23 months
Age in months					
6-8	100.0	10.5	54.4	10.5	161
9-11	98.6	31.9	66.5	29.8	144
12-17	98.7	41.4	74.2	38.0	296
18-23	93.7	58.7	84.3	51.5	286
Sex					
Male	96.7	38.8	72.8	34.3	420

Primary complete	99.0	34.4	68.5	31.4	101
Secondary incomplete	97.5	41.9	74.9	37.7	325
Secondary complete or higher	98.4	54.3	81.5	51.0	180
Household asset quintile					
Lowest	97.4	31.0	69.7	29.1	152
Second	98.9	38.0	72.6	33.6	169
Middle	95.9	34.1	68.8	30.4	179
Fourth	97.2	42.5	76.8	40.3	181
Highest	97.2	50.5	74.4	44.3	206
Total project areas	97.3	39.8	72.6	36.0	887
Total nonproject areas	96.8	39.2	71.2	34.7	842

Note: Less than four percent of children were not breastfed.

¹ Includes two or more feedings of commercial infant formula; fresh, tinned, and powdered animal milk; and yogurt.

² Food groups: a) infant formula, milk other than breast milk, cheese or yogurt, or other milk products; b) foods made from grains, roots, and tubers, including porridge and fortified baby food from grains; c) vitamin A-rich fruits and vegetables (and red palm oil); d) other fruits and vegetables; e) eggs; f) meat, poultry, fish, and shellfish (and organ meats); and g) legumes and nuts.

³ Fed solid or semi-solid food at least twice a day for infants 6-8 months, 3+ times for other breastfed children, and 4+ times for nonbreastfed children.

⁴ Nonbreastfed children ages 6-23 months are considered to be fed with a minimum standard of three Infant and young child feeding practices if they receive other milk or milk products and are fed at least the minimum number of times per day with at least the minimum number of food groups.

Chapter 8. Knowledge and Awareness of Smiling Sun Providers

Table 8.1: Knowledge and awareness of temporary and satellite clinics

Percentage of ever-married women ages 15–49 who are aware of a temporary/satellite clinic in their area, who know whether such a clinic was held in the past three months, and among those who reported temporary/satellite clinic held in the past three months, percentage distribution by type of clinic, by project and nonproject areas, and by background characteristics (project areas), urban NHSDP 2014.

Background characteristics	Aware of temporary clinics	Number of women	Among those aware of a temporary clinic			Type of temporary/satellite clinic				Number of women reporting clinics in past 3 months
			Clinic held in past three months	Number of women	Smiling Sun satellite clinic ¹	Govt. satellite clinic	Other	Don't know/missing	Total

Age 45-49	0.11	6,887	0.10	7,239	-0.01	0.01	0.07	-0.03
Who never gave birth	0.10	6,887	0.10	7,239	0.01	0.01	0.39	0.02
Who gave birth to 1-2 children	0.50	6,887	0.51	7,239	0.01	0.01	0.26	0.02
Who completed all primary education	0.15	5,151	0.17	5,542	0.01	0.01	0.15	0.03
Who completed some secondary education	0.37	5,151	0.37	5,542	-0.00	0.01	0.73	-0.01
Who completed all secondary education	0.24	5,151	0.22	5,542	-0.02	0.02	0.14	-0.06
Who are Muslim	0.91	6,887	0.92	7,239	0.01	0.02	0.48	0.05
Who are from the lowest wealth quintile	0.21	6,887	0.17	7,239	-0.04	0.02	0.04	-0.10
Who are from the second lowest wealth quintile	0.21	6,887	0.19	7,239	-0.01	0.01	0.20	-0.04
Who are from the middle wealth quintile	0.19	6,887	0.20	7,239	0.01	0.01	0.32	0.03
Who are from the fourth wealth quintile	0.20	6,887	0.21	7,239	0.01	0.01	0.35	0.03
Who are from the highest wealth quintile	0.19	6,887	0.23	7,239	0.03	0.02	0.06	0.08
Who are living with their husbands	0.92	6,351	0.94	6,745	0.02	0.01	0.04	0.06

¹ All balance tests use sample weights to account for the survey sample design.

Table 3: Balance tests for family planning indicators in comparison and project areas, urban NHSDP 2014

	Comparison		Project		Mean	Diff	Effect	
	Mean	N1	Mean	N2	Diff	SE	p-value	Size
Among currently married women:								
Proportion of currently married women of reproductive age (CMWRA) who are currently using a modern contraceptive method	0.58	6,351	0.60	6,745	0.02	0.01	0.05	0.04
Proportion of CMWRA who are using long-acting methods	0.07	6,351	0.07	6,745	-0.01	0.01	0.16	-0.03

Table 4: Balance tests for birth planning indicators in comparison and project areas, urban NHSDP 2014

	Comparison		Project		Mean	Diff	Effect	
	Mean	N1	Mean	N2	Diff	SE	p-value	Size
Among currently pregnant women:								
Proportion who decided where to deliver during 1st trimester	0.44	344	0.37	322	-0.07	0.04	0.09	-0.15
Proportion who decided where to deliver during 2nd trimester	0.18	344	0.20	322	0.02	0.03	0.56	0.05
Proportion who decided where to deliver during 3rd trimester	0.06	344	0.09	322	0.03	0.02	0.26	0.10

Table 5: Balance tests for delivery care indicators in comparison and project areas, urban NHSDP 2014

	Comparison		Project		Mean	Diff	Effect	
	Mean	N1	Mean	N2	Diff	SE	p-value	Size
Among MWRA age 15-49 who had a live-birth in the 3 years preceding the survey:								
Proportion who received 4+ ANC from any provider for last birth	0.44	1,638	0.50	1,739	0.06	0.02	0.02	0.12
Proportion who received at least one ANC from a medically trained provider	0.82	1,638	0.81	1,739	-0.00	0.02	0.82	-0.01
Proportion who delivered the last baby at a health facility	0.49	1,638	0.48	1,739	-0.01	0.03	0.69	-0.02
Proportion who delivered the last baby at home	0.48	1,638	0.47	1,739	-0.01	0.03	0.76	-0.02
Proportion who received assistance from a medically trained provider (MTP) for delivery	0.55	1,638	0.57	1,739	0.01	0.03	0.83	0.01
Proportion who had used a mobile phone for pregnancy-related reasons	0.20	1,638	0.22	1,739	0.03	0.02	0.08	0.07
Proportion who had heard of Shurjer Hashi/ Mayer Bank	0.13	1,638	0.19	1,739	0.06	0.02	0.00	0.17

Table 6: Balance tests for postnatal care indicators in comparison and project areas, urban NHSDP 2014

Among MWRA age 15-49 who had a live-birth in the 3 years preceding the survey:	Comparison		Project		Mean	Diff	Effect	
	Mean	N1	Mean	N2	Diff	SE	p-value	Size
Proportion of women who received a postnatal checkup within 48 hours of delivery from any provider	0.63	1,634	0.58	1,739	-0.05	0.02	0.04	-0.10
Proportion of women who received a postnatal checkup within 48 hours from a medically trained provider	0.52	1,634	0.51	1,739	-0.01	0.03	0.66	-0.02
Proportion of newborns who received a postnatal checkup within 48 hours from any provider	0.63	1,634	0.58	1,739	-0.05	0.02	0.04	-0.10
Proportion of newborns who received a postnatal checkup within 48 hours from a medically trained provider	0.53	1,634	0.51	1,739	-0.02	0.03	0.56	-0.03

Table 7: Balance tests for newborn care indicators among home births in comparison and project areas, urban NHSDP 2014

For the most recent newborn delivered at home during the 3 years preceding survey:	Comparison		Project		Mean	Diff	Effect	
	Mean	N1	Mean	N2	Diff	SE	p-value	Size
Percentage who used a blade from a delivery bag to cut the cord	0.23	786	0.21	816	-0.01	0.03	0.58	-0.03
Percentage for whom nothing was applied to the cord after it was cut	0.29	786	0.34	816	0.05	0.03	0.06	0.11
Percentage of newborns who were dried within 0-4 minutes of birth	0.69	1,634	0.68	1,739	-0.01	0.02	0.73	-0.02
Percentage for whom first bathing was delayed until 72 hours	0.41	1,634	0.37	1,739	-0.04	0.02	0.06	-0.09
Percentage of newborns delivered at home who were breastfed within one hour of birth	0.35	1,634	0.36	1,739	0.01	0.02	0.52	0.03

INFORMED CONSENT

AFTER ASSEMBLING THE INFORMANTS, READ THE FOLLOWING GREETING:

Hello. My name is _____ . We come from _____ , a private research organization, located in Dhaka. To assist in the implementation of development programs in the country, we conduct different types of surveys. We are carrying out a survey of communities to get a picture of services available to the communities and to understand when and why people use health services. We would like to ask you some questions about your community and about sources of health care in it and around it as a way of better understanding how to serve the population. Please be assured that this discussion is strictly confidential, the information gathered will never be linked back to you and you may choose to stop the interview at any time. The survey usually takes between 20 and 35 minutes to complete. The information you provide will be used by researchers to inform design and evaluation of programs. No information that identifies you will be included with the data.

Participation in this survey is voluntary and you can choose not to answer any individual question or all of the questions. However, we hope that you will participate in this survey since your views are important. If you wish to know more about your rights as a participant in this study you may write to the Institutional Review Board, CB # 7097, Medical Building 52, 105 Mason Farm Road, Chapel Hill, NC 27599-7400 U.S.A., or call, collect if necessary, 001-919-966-3012. If you have further questions regarding the nature of this study you may contact (ACPR 3/10, Block-A, Lalmatia, Dhaka-1207 or phone 8117926 and 9114784)

At this time, do you want to ask me anything about the survey?

May I begin the interview now?

Signature of interviewer: _____ Date: _____

Respondent agrees to be interviewed 1 Respondent does not agree to be interviewed 2 → End

Section 2. Health Service Availability

Now we would like to ask you some questions about health facilities from which people in this community can obtain services if they want. We would like for you to tell us about all of the facilities known by the general population of this community that are of specific types. Please start with the ones that are closest to this community.

201. HEALTH FACILITY	201. Where is the HEALTH FACILITY located?	202. What is HEALTH FACILITY's operating authority?	203. What is NGO FACILITY's operating authority?	203a. What services does (Facility) provide?	204. How far in miles/kilometers is the FACILITY located from the center of the community? IF LOCATED IN THE community MGHALLA, RECORD '00'	205. What is the shortest time needed to walk to the health facility from center of the community?	206. When did the FACILITY first open?	207. For how long has the HEALTH FACILITY been open?	208. Is the HEALTH FACILITY in this thana/ Union?

Informed Consent for Household Questionnaire

Title of Research: NGO Health Service Delivery Project (NHSDP) Urban Baseline Survey, 2014

Principal Investigator: Mitra/ACPR

Participating Institution: Mitra/ACPR

Introductory statement:

My name is I am from Mitra/ACPR. To assist in the implementation of socio-development programs in the country, we conduct different types of surveys. We are now conducting a survey about the health of women and children for the NGO Health Service Delivery Program. The survey is funded by the United States Agency for International Development (USAID). The data will be used by ICDDR,B, Mitra & Associates, ACPR, the University of North Carolina in Chapel Hill, North Carolina (UNC), USA, and other approved researchers. Your opinion is very important to us.

Why the study is being undertaken:

The study will help to understand the state and determinants of health in Bangladesh.

Who is involved in the study:

You have been selected as a respondent in this study. As part of the survey we would first like to ask some questions about your household which will help us to plan health services.

What you would have to do if you agree to participate:

If you agree to participate, we will ask you some questions related to physical, demographic, and socio-economic characteristics of the household. The interview will take around 15 minutes of your time.

What are the risks & benefits of this study:

There is no risk involved in your participation in this interview, rather it will help Government particularly Ministry of Health and Family Welfare (MOHFW) and private and NGO sector health providing agencies to formulate policy plans and develop programs.

Confidentiality:

The interview will be conducted in a private setting. Your responses will be kept strictly confidential. Your name will not appear in any report. No names and other identifying information will be included in the data. Only approved researchers will have access to the data, which they will use to prepare the report. All the data will be stored in a locked and secured place.

Is there any compensation for participating in the study:

Your participation is voluntary and you will not be paid any monetary compensation for your participation in this survey.

Right to refuse or withdraw:

Your participation in this interview is completely voluntary. You can refuse to respond to any question if you wish. You can also stop the interview at any time. However, we hope that you will participate in this survey since your views are important.

Who do I contact if I have questions of problem:

If you wish to know more about your rights as a participant in this study you may contact the Bangladesh Medical Research Council (BMRC), Mohakhali, Dhaka, Phone: 8819311, 8828396 or the Institutional Review Board (IRB) at the School of Public Health, CB # 7400, University of North Carolina at Chapel Hill, Chapel Hill, NC 27599-7400 U.S.A., or call, collect if necessary, 001-919-966-3012. You may ask any questions or clarifications before giving your consent for interview regarding the nature of the study. You may also contact Prof. Dr. M Sekander H. Khan, Advisor, ACPR, 3/10, Block A, Lalmatia, Dhaka-1207, Bangladesh. Phone:

Informed Consent for Woman Questionnaire

Title of Research: NGO Health Service Delivery Project (NHSDP) Urban Baseline Survey, 2014

Principal Investigator: ACPR/Mitra

Participating Institution: ACPR/Mitra

Introductory statement:

My name is I am from **ACPR/Mitra**. To assist in the implementation of socio-development programs in the country, we conduct different types of surveys. We are now conducting a survey about the health of women and children for the NGO Health Service Delivery Program. The survey is funded by the United States Agency for International Development (USAID). The data will be used by ICDDR,B, Mitra & Associates, ACPR, the University of North Carolina in Chapel Hill, North Carolina (UNC), USA, and other approved researchers. Your opinion is very important to us.

Why is the study being conducted:

The study will help to understand the state and determinants of health in Bangladesh.

Who is involved in the study:

You have been selected as a respondent in this study. As part of the survey we would first like to ask some questions about yourself and your children which will help us to plan health services.

What you would have to do if you agree to participate:

If you agree to participate, we will ask you some questions related to physical, demographic, socio-economic characteristics of the household and to your health and your children's health. The interview will take around 45 minutes of your time.

If you have given birth recently, someone may come back at a later stage to ask further follow-up questions on that delivery. If someone does come back, you can choose whether to participate in the follow up questions at that time.

What are the risks & benefits of this study:

There is no risk involved in your participation in this interview, rather it will help Government particularly Ministry of Health and Family Welfare (MOHFW) and private and NGO sector health providing agencies to formulate policy plans and develop programs.

Confidentiality:

The interview will be conducted in a private setting. Your responses will be kept strictly confidential. Your name will not appear in any report. No names and other identifying information will be included in the data. Only approved researchers will have access to the data, which they will use to prepare the report. All the data will be stored in a locked and secured place.

Is there any compensation for participating in the study:

Your participation is voluntary and you will not be paid any monetary compensation for your participation in this survey.

Right to refuse or withdraw:

Your participation in this interview is completely voluntary. You can refuse to respond to any question if you wish. You can also stop the interview at any time. However, we hope that you will participate in this survey since your views are important.

Who do I contact if I have questions of problem:

If you wish to know more about your rights as a participant in this study you may contact the Bangladesh Medical Research Council (BMRC), Mohakhali, Dhaka, Phone:8819311, 8828396 or the Institutional Review Board (IRB) at the School of Public Health, CB # 7400, University of North Carolina at Chapel Hill, Chapel Hill, NC 27599-7400 U.S.A., or call, collect if necessary, 001-919-966-3012. You may ask any questions or clarifications before giving your consent for interview regarding the nature of the study. You may also contact Prof. Dr. M Sekander H. Khan, Advisor, ACPR, 3/10, Block A, Lalmatia, Dhaka-1207, Bangladesh. Phone: 8117926, 9114784.

If you do not have any question, do I have your permission to continue?
